Phone-assisted token coverage over time

longtail_eval_v2 | OP15 + Pixel | 14 requests | 3,604 output tokens | 25 September 2026

82.8% overall coverage

2,985 / 3,604 tokens received FFN assistance

Qwen

1,298 / 1,524 assisted
1,196 also use Pixel

Gemma

1,687 / 2,034 assisted
OP15 only

Llama

0 / 46 assisted
Desktop only

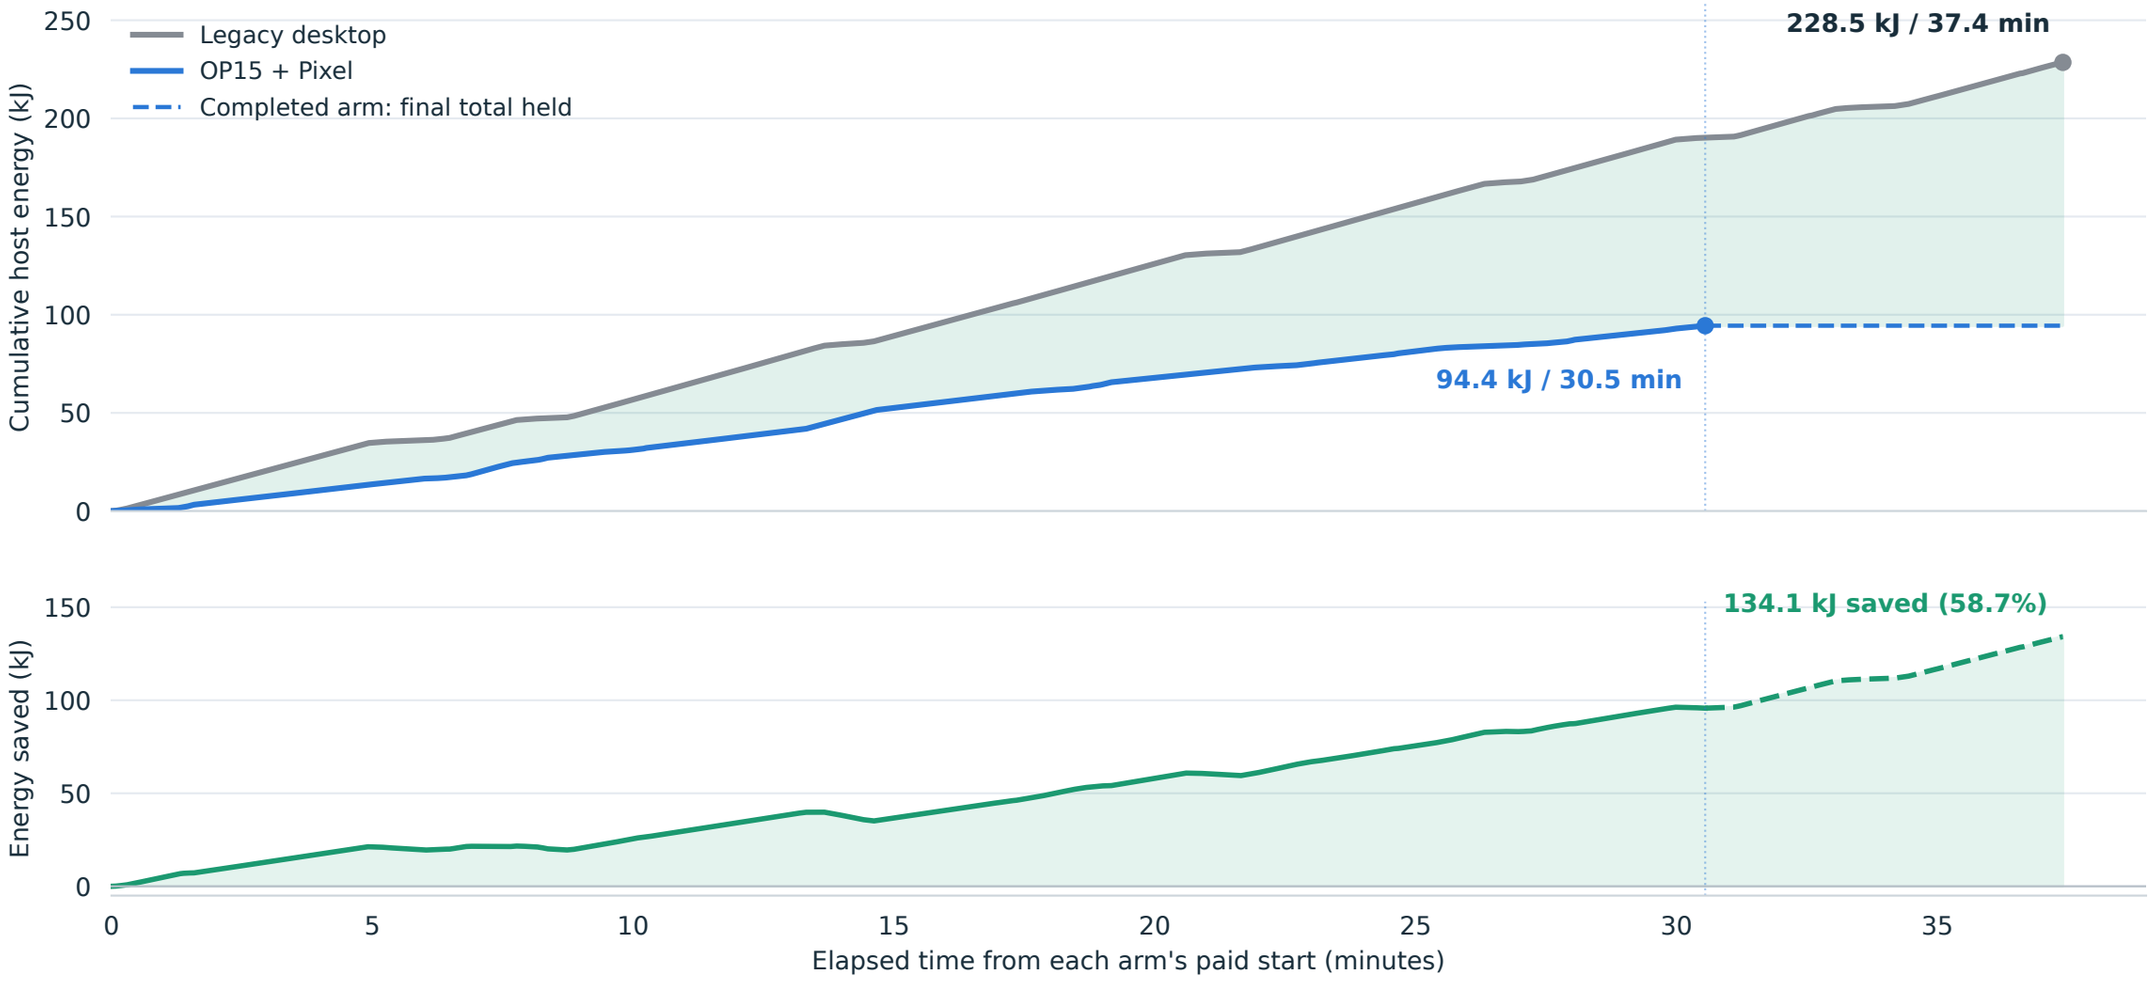

Selected FFN layers are offloaded. A token using both phones is counted once; Pixel is a subset of Qwen coverage.
All output tokens, including first tokens from prefill, are counted. 61 tokens lack individual timestamps and are placed at completion.
Counts match request-scoped physical call proofs. Exact-output check: 13/14 sequences; strict identity FAIL.

Host energy and savings over time

longtail_eval_v2 | Legacy desktop vs OP15 + Pixel full configuration | Measured CPU package + GPU board

58.7% less host energy

134.1 kJ saved | 18.3% shorter trace

The time-aligned gap compares equal elapsed time, not equal completed work. Final totals compare the complete 14-request trace.
After the assisted arm finishes, its paid energy total is held flat; no idle energy is extrapolated. Phone energy is excluded.
Single matched pair; exact-output check 13/14 (strict identity FAIL). The Pixel-only contribution is not isolated by this comparison.
